Edu4U Project Documentation

1. Registration Page

Overview: The Registration Page serves as the entry point for new users. I designed it with a modern Split-Screen Layout to provide a professional look and feel. The form collects essential user information: Full Name, Email, and Password.

Backend Logic: When a user submits the form, the data is processed by the register.php script. To ensure security, I used the PHP password_hash function to encrypt the password before storing it in the database. This prevents sensitive user credentials from being stored as plain text.

```
<div class="input-group">
  <label for="username" id="username-label">الاسم كاملاً</label>
  <input type="text" id="username" name="username" required placeholder=
</div>

<div class="input-group">
  <label for="email" id="email-label">البريد الإلكتروني</label>
  <input type="email" id="email" name="email" required placeholder="exam
</div>

<div class="input-group">
  <label for="password" id="password-label">كلمة المرور</label>
  <input type="password" id="password" name="password" required placehol
</div>

<div class="input-group">
  <label for="confirm_password" id="confirm-password-label">كلمة المرور</label>
  <input type="password" id="confirm_password" name="confirm_password" r
```

2. Login Page

Overview: This page acts as the secure gateway for returning users. It features a clean, centered interface that prompts the user for their Email and Password.

Backend Logic: The login form submits credentials to login.php. The script connects to the MySQL database and uses the password_verify function to check the entered password against the stored hash. Upon successful verification, the system executes session_start() to store the user_id and username. This session management keeps the user authenticated as they navigate through the restricted sections of the site.

```
<div class="main-split-container">
  <div class="welcome-text-panel">
    <h1 id="welcome-title">مرحباً بك في منصة التعليم لأجلك</h1>

    <div class="feature-box">
      <h3 id="feature1-title">جاهز للبدء</h3>
      <p id="feature1-text">ابدأ رحلتك التعليمية معنا واحصل على أفضل المهارات.</p>
    </div>

    <div class="feature-box">
      <h3 id="feature2-title">وفر وقتك</h3>
      <p id="feature2-text">تعلم في أي وقت ومن أي مكان بسهولة وراحة.</p>
    </div>
  </div>

  <div class="login-container">
    <h2 id="login-title">تسجيل الدخول</h2>
    <form action="login.php" method="POST">
      <div class="input-group">
        <label for="email" id="email-label">البريد الإلكتروني</label>
        <input type="email" id="email" name="email" required placeholder="example@email.com">
      </div>

      <div class="input-group">
        <label for="password" id="password-label">كلمة المرور</label>
        <input type="password" id="password" name="password" required placeholder="*****">
      </div>
    </form>
  </div>
</div>
```

3. Home Page

Overview: The Home Page functions as the central hub of the platform. It features a responsive "Hero Section" with a welcoming message and a call-to-action button to encourage users to start learning immediately.

Key Features:

- **Dark Mode:** I implemented a custom theme toggler using CSS variables (e.g., `--bg-color`). A JavaScript function switches these variables instantly to change the theme without reloading the page.
- **Localization:** The platform supports both Arabic and English. A JavaScript dictionary object updates text elements dynamically and adjusts the page direction (RTL/LTR) based on the user's choice.

4. My Courses Page

Overview: The "My Courses" dashboard visualizes the student's personal learning journey. It displays only the courses the student has actively enrolled in.

Technical Logic: This page relies on the `my_courses.js` script. It retrieves enrollment data and progress status from the browser's Local Storage. The script then calculates the completion percentage (Completed Videos / Total Videos) and dynamically renders a visual progress bar for each course to motivate the student.

```
</div>
<ul class="nav-links">
  <li><a href="home.html" data-lang="nav-home">الرئيسية</a></li>
  <li class="active-link"><a href="my_courses.html" class="active" data-lang="nav-mycourses">كورساتي</a></li>
  <li><a href="courses.html" data-lang="nav-courses">جميع الكورسات</a></li>
  <li><a href="calculator.html" data-lang="nav-calc">الحاسبة</a></li>
</ul>

<div class="nav-icons-group">
  <div class="account-dropdown">
    <button class="nav-icon-btn account-btn" title="Account">
      <i class="fas fa-user-circle"></i>
    </button>
    <div class="dropdown-content">
      <a href="profile.html" data-lang="acc-profile">حسابي</a>
      <a href="login.html" data-lang="acc-logout">تسجيل الخروج</a>
    </div>
  </div>
  <button id="lang-toggle" class="nav-icon-btn" title="Change Language">
    <i class="fas fa-globe"></i>
  </button>
  <button id="theme-toggle" class="nav-icon-btn" title="Toggle Light/Dark Mode">
    
  </button>
</div>
```

5. Profile Page

Overview: The Profile Page allows users to manage their account settings securely and view their account information.

Functionality:

- **Update Username:** Users can change their display name via the `update_username.php` script, which verifies that the new name is not already taken before updating the database record.
- **Change Password:** The `update_password.php` script handles this sensitive operation. It first verifies the user's current password, ensures the new password matches the confirmation field, and then hashes the new password before saving it to the database.

```
</form>
</section>

<hr>

<section class="section-container">
  <h2>تغيير كلمة المرور</h2>
  <form action="update_password.php" method="POST" onsubmit="return validateForm()">
    <div class="input-group">
      <label for="current_password">كلمة المرور الحالية:</label>
      <input type="password" id="current_password" name="current_password" required>
    </div>
    <div class="input-group">
      <label for="new_password">كلمة المرور الجديدة:</label>
      <input type="password" id="new_password" name="new_password" minlength="6" required>
    </div>
    <div class="input-group">
      <label for="confirm_password">تأكيد كلمة المرور الجديدة:</label>
      <input type="password" id="confirm_password" name="confirm_password" required>
      <span id="passwordMatch" style="color: #c62828; display: none; font-size: 0.9em; margin-top: 5px;">
        كلمات المرور غير متطابقة
      </span>
    </div>
    <button type="submit" class="save-btn">تغيير كلمة المرور</button>
  </form>
</section>
```

All Courses Page

Overview: The "All Courses" page serves as the main catalog for the platform. It is designed to be dynamic and responsive, displaying course cards in a flexible grid layout.

Key Features:

- **Real-Time Search:** I implemented a "Live Search" feature using JavaScript. As the user types in the search bar, the code filters the course titles instantly (DOM manipulation) and hides irrelevant cards without reloading the page.
- **Enrollment Logic:** When a user clicks the "Free" button, the system uses the browser's Local Storage to save the enrollment state. The button text immediately updates to "Added," providing instant visual feedback to the user.

```
<div class="dropdown-content">
  <a href="profile.html" data-lang="acc-profile">حسابي</a>
  <a href="login.html" data-lang="acc-logout">تسجيل الخروج</a>
</div>
</div>
<button id="lang-toggle" class="nav-icon-btn" title="Change Language">
  <i class="fas fa-globe"></i>
</button>
<button id="theme-toggle" class="nav-icon-btn" title="Toggle Light/Dark Mode">
  
</button>
</div>
</nav>
<main class="courses-page-content">
  <div class="top-filters-row">
    <div class="course-count-info">
      <h1>عرض <span id="displayed-count">3</span> كورسات</h1>
    </div>
    <div class="search-box">
      <input type="text" id="course-search" placeholder="ابحث باسم الكورس">
      <i class="fas fa-search"></i>
    </div>
  </div>
</div>
```

Database Architecture & Connection

1. PHP Connection Logic (db.php) To establish a communication channel between the application and the database, I wrote a dedicated connection script.

- **Method:** I used the `mysqli_connect` function to connect to the localhost server using the root user and the specific database named mywebsite.
- **Error Handling:** The script includes a conditional check (`if ($conn->connect_error)`) to immediately stop execution and display an error message if the connection fails, ensuring easier debugging.

2. Database Schema (SQL) I designed the users table to securely store account information using the following structure:

- **id:** Set as PRIMARY KEY and AUTO_INCREMENT to give every user a unique, self-generating identifier.
- **email:** Marked as UNIQUE to prevent duplicate accounts with the same email address.
- **password:** Defined as VARCHAR(255) to ensure enough space for storing long, encrypted password hashes generated by the backend security functions.

```
<?php
$host = "localhost";
$user = "root";
$pass = "";
$db   = "mywebsite";

$conn = mysqli_connect("localhost", "root", "" , "mywebsite");

if ($conn->connect_error) {
    die("Connection failed: " . $conn->connect_error);
}
?>
```
